"Innovation" is the hottest buzzword in business. But what if our obsession with finding the next big thing has distracted us from the work that matters most? "The most important book I've read in a long time . . . It explains so much about what is wrong with our technology, our economy, and the world, and gives a simple recipe for how to fix it: Focus on understanding what it takes for your products and services to last."—Tim O'Reilly, founder of O'Reilly Media It's hard to avoid

innovation these days. Nearly every product gets marketed as being disruptive, whether it's genuinely a new invention or just a new toothbrush. But in this manifesto on the state of American work, historians of technology Lee Vinsel and Andrew L. Russell argue that our way of thinking about and pursuing innovation has made us poorer, less safe, and—ironically—less innovative. Drawing on years of original research and reporting, *The Innovation Delusion* shows how the ideology of change for its own sake has proved a disaster. Corporations have spent millions hiring chief innovation officers while their core businesses tank. Computer science programs have drilled their students on programming and design, even though the overwhelming majority of jobs are in IT and maintenance. In countless cities, suburban sprawl has left local governments with loads of deferred repairs that they can't afford to fix. And sometimes innovation even kills—like in 2018 when a Miami bridge hailed for its innovative design collapsed onto a highway and killed six people. In this provocative, deeply researched book, Vinsel and Russell tell the story of how we devalued the work that underpins modern life—and, in doing so, wrecked our economy and public infrastructure while lining the pockets of consultants who combine the ego of Silicon Valley with the worst of Wall Street's greed. The authors offer a compelling plan for how we can shift our focus away from the pursuit

of growth at all costs, and back toward neglected activities like maintenance, care, and upkeep. For anyone concerned by the crumbling state of our roads and bridges or the direction our economy is headed, *The Innovation Delusion* is a deeply necessary reevaluation of a trend we can still disrupt.

Social innovation (SI) has, in the last decade or so, become an important idea and concept in policy, practice and scholarship surrounding human development. It is often seen as an antidote to narrowly defined technological and market-oriented modes of innovation. Its historical significance and development, tied to centuries of struggles for social change, remain under-appreciated and unacknowledged. This *Advanced Introduction* explores the historical and contemporary meanings of social innovation and its relationship with political and social movements. It develops an understanding of SI as a form of ethical practice for meeting needs, transforming social relations, and collectively empowering communities to shape the future. Additionally, it proposes that ethical research should aim to be socially innovative in this sense and provides concrete suggestions of how this concern can be embodied in action-research and community development methodologies.

From social media to mortgage-backed

securities, innovation carries both risk and opportunity. Groups of people win, and lose, when innovation changes the ground rules. Looking beyond formal politics, this new book by Cristie Ford argues that we need to recognize innovation, and financial innovation in particular, as a central challenge for regulation. Regulation is at the leading edge of politics and policy in ways that we have not yet fully grasped. Seemingly innocuous regulatory design choices have clear and profound practical ramifications for many of our most cherished social commitments. Innovation is a complex phenomenon that needs to be understood not only in technical terms, but also in human ones. Using financial regulation as her primary example, Ford argues for a fresh approach to regulation, which recognizes innovation for the regulatory challenge that it is, and which binds our cherished social values and our regulatory tools ever more tightly together.

The Challenge Built to Last, the defining management study of the nineties, showed how great companies triumph over time and how long-term sustained performance can be engineered into the DNA of an enterprise from the very beginning. But what about the company that is not born with great DNA? How can good companies, mediocre companies, even bad companies achieve enduring greatness? The Study For years, this question preyed on the

mind of Jim Collins. Are there companies that defy gravity and convert long-term mediocrity or worse into long-term superiority? And if so, what are the universal distinguishing characteristics that cause a company to go from good to great? The Standards Using tough benchmarks, Collins and his research team identified a set of elite companies that made the leap to great results and sustained those results for at least fifteen years. How great? After the leap, the good-to-great companies generated cumulative stock returns that beat the general stock market by an average of seven times in fifteen years, better than twice the results delivered by a composite index of the world's greatest companies, including Coca-Cola, Intel, General Electric, and Merck. The Comparisons The research team contrasted the good-to-great companies with a carefully selected set of comparison companies that failed to make the leap from good to great. What was different? Why did one set of companies become truly great performers while the other set remained only good? Over five years, the team analyzed the histories of all twenty-eight companies in the study. After sifting through mountains of data and thousands of pages of interviews, Collins and his crew discovered the key determinants of greatness -- why some companies make the leap and others don't. The Findings The findings of the Good to Great study will surprise many readers and shed light on virtually every

area of management strategy and practice. The findings include: Level 5 Leaders: The research team was shocked to discover the type of leadership required to achieve greatness. The Hedgehog Concept (Simplicity within the Three Circles): To go from good to great requires transcending the curse of competence. A Culture of Discipline: When you combine a culture of discipline with an ethic of entrepreneurship, you get the magical alchemy of great results. Technology Accelerators: Good-to-great companies think differently about the role of technology. The Flywheel and the Doom Loop: Those who launch radical change programs and wrenching restructurings will almost certainly fail to make the leap. "Some of the key concepts discerned in the study," comments Jim Collins, "fly in the face of our modern business culture and will, quite frankly, upset some people." Perhaps, but who can afford to ignore these findings?

How do you convert a potentially life-saving new idea into an actual medical product and then make it available to doctors and patients? Joseph Gulfo thought he knew what to do but he thought wrong.

Innovation Work (30,000 copies sold and translated into ten languages) comes a book that questions everything about how organizations innovate. Key takeaway: classical business management and corporate structures by their very nature will kill, not create, breakthroughs. The authors describe a new kind of organization--the startup corporation--that will make established companies as innovative as startups"--

This myth-busting book shows large companies can construct a strategy, system, and culture of innovation that creates sustained growth. Every company wants to grow, and the most proven way is through innovation. The conventional wisdom is that only disruptive, nimble startups can innovate; once a business gets bigger and more complex corporate arteriosclerosis sets in. Gary Pisano's remarkable research conducted over three decades, and his extraordinary on-the ground experience with big companies and fast-growing ones that have moved beyond the start-up stage, provides new thinking about how the scale of bigger companies can be leveraged for advantage in innovation. He begins with the simply reality that bigger companies are, well, different. Demanding that they "be like Uber" is no more realistic than commanding your dog to speak French. Bigger companies are complex. They need to sustain revenue streams from existing businesses, and deal

with Wall Street's demands. These organizations require a different set of management practices and approaches--a discipline focused on the strategies, systems and culture for taking their companies to the next level. Big can be beautiful, but it requires creative construction by leaders to avoid the creative destruction that is all-too-often the fate of too many.

How disruptions and discontinuities caused by the introduction of new technologies often reveal aspects of practice not previously observed.
