Well cementing - Wikipedia

Cementing also reduces water production, helps to attain zonal isolation, and improves confinement of stimulation treatments. The Cementing process in CO₂ injection wells should be carried out in such a way that it mitigates the risk of CO₂ leakage and degradation. There are two types of Cementing, i.e., primary and secondary cementing.

Introduction. Oil well cementing is an important process of drilling and completion operation. The cement slurry is placed between the casing and the drilled formation for adequate zonal isolation for the lifetime of the well . Cementing operation is generally classified into two categories as primary cementing and remedial cementing.

The well is created by drilling a hole 12 cm to 1 meter (5 in to 40 in) in diameter into the earth with a drilling rig that rotates a drill string with a bit attached. After the hole is drilled, sections of steel pipe (), slightly smaller in diameter than the borehole, are placed in the hole. Cement may be placed between the outside of the casing and the borehole known as the annulus.

Chemical Additives for Oil Well Cementing

Cementing is one of the most important operations performed on a well in order to ensure complete zonal isolation, aquifer protection, and the structural integrity of the wellbore. Without it, the well may never reach its full production potential, and liquids from one zone could interfere with, or be lost to, another.
